## Confronting Climate Uncertainty in Water Resources Planning and Investment Design

Diego J. Rodriguez  
Senior Water Resources Management Specialist  
World Bank

# Outline

**Tema 01 – Traditional planning process**

**Tema 02 - Recent approaches to planning: robust decision making under uncertainty**

**Tema 03 - The example of Mexico: Cutzamala System**

**Tema 04 – 5 key takeaways**

# TRADITIONAL PLANNING APPROACH

## Traditional planning process: 'Predict and Act'

What would be  
the future?

What is the best  
decision according  
to our future  
scenario?

To what extent our  
decision depends on  
our forecast?

**This method is not effective when facing uncertainty and/or we have different views from decision makers and stakeholders.**

# Year 2000? Forecasting in 1900....

# Another example of the challenges of forecasting

Gross national product (trillions of 1958 dollars)

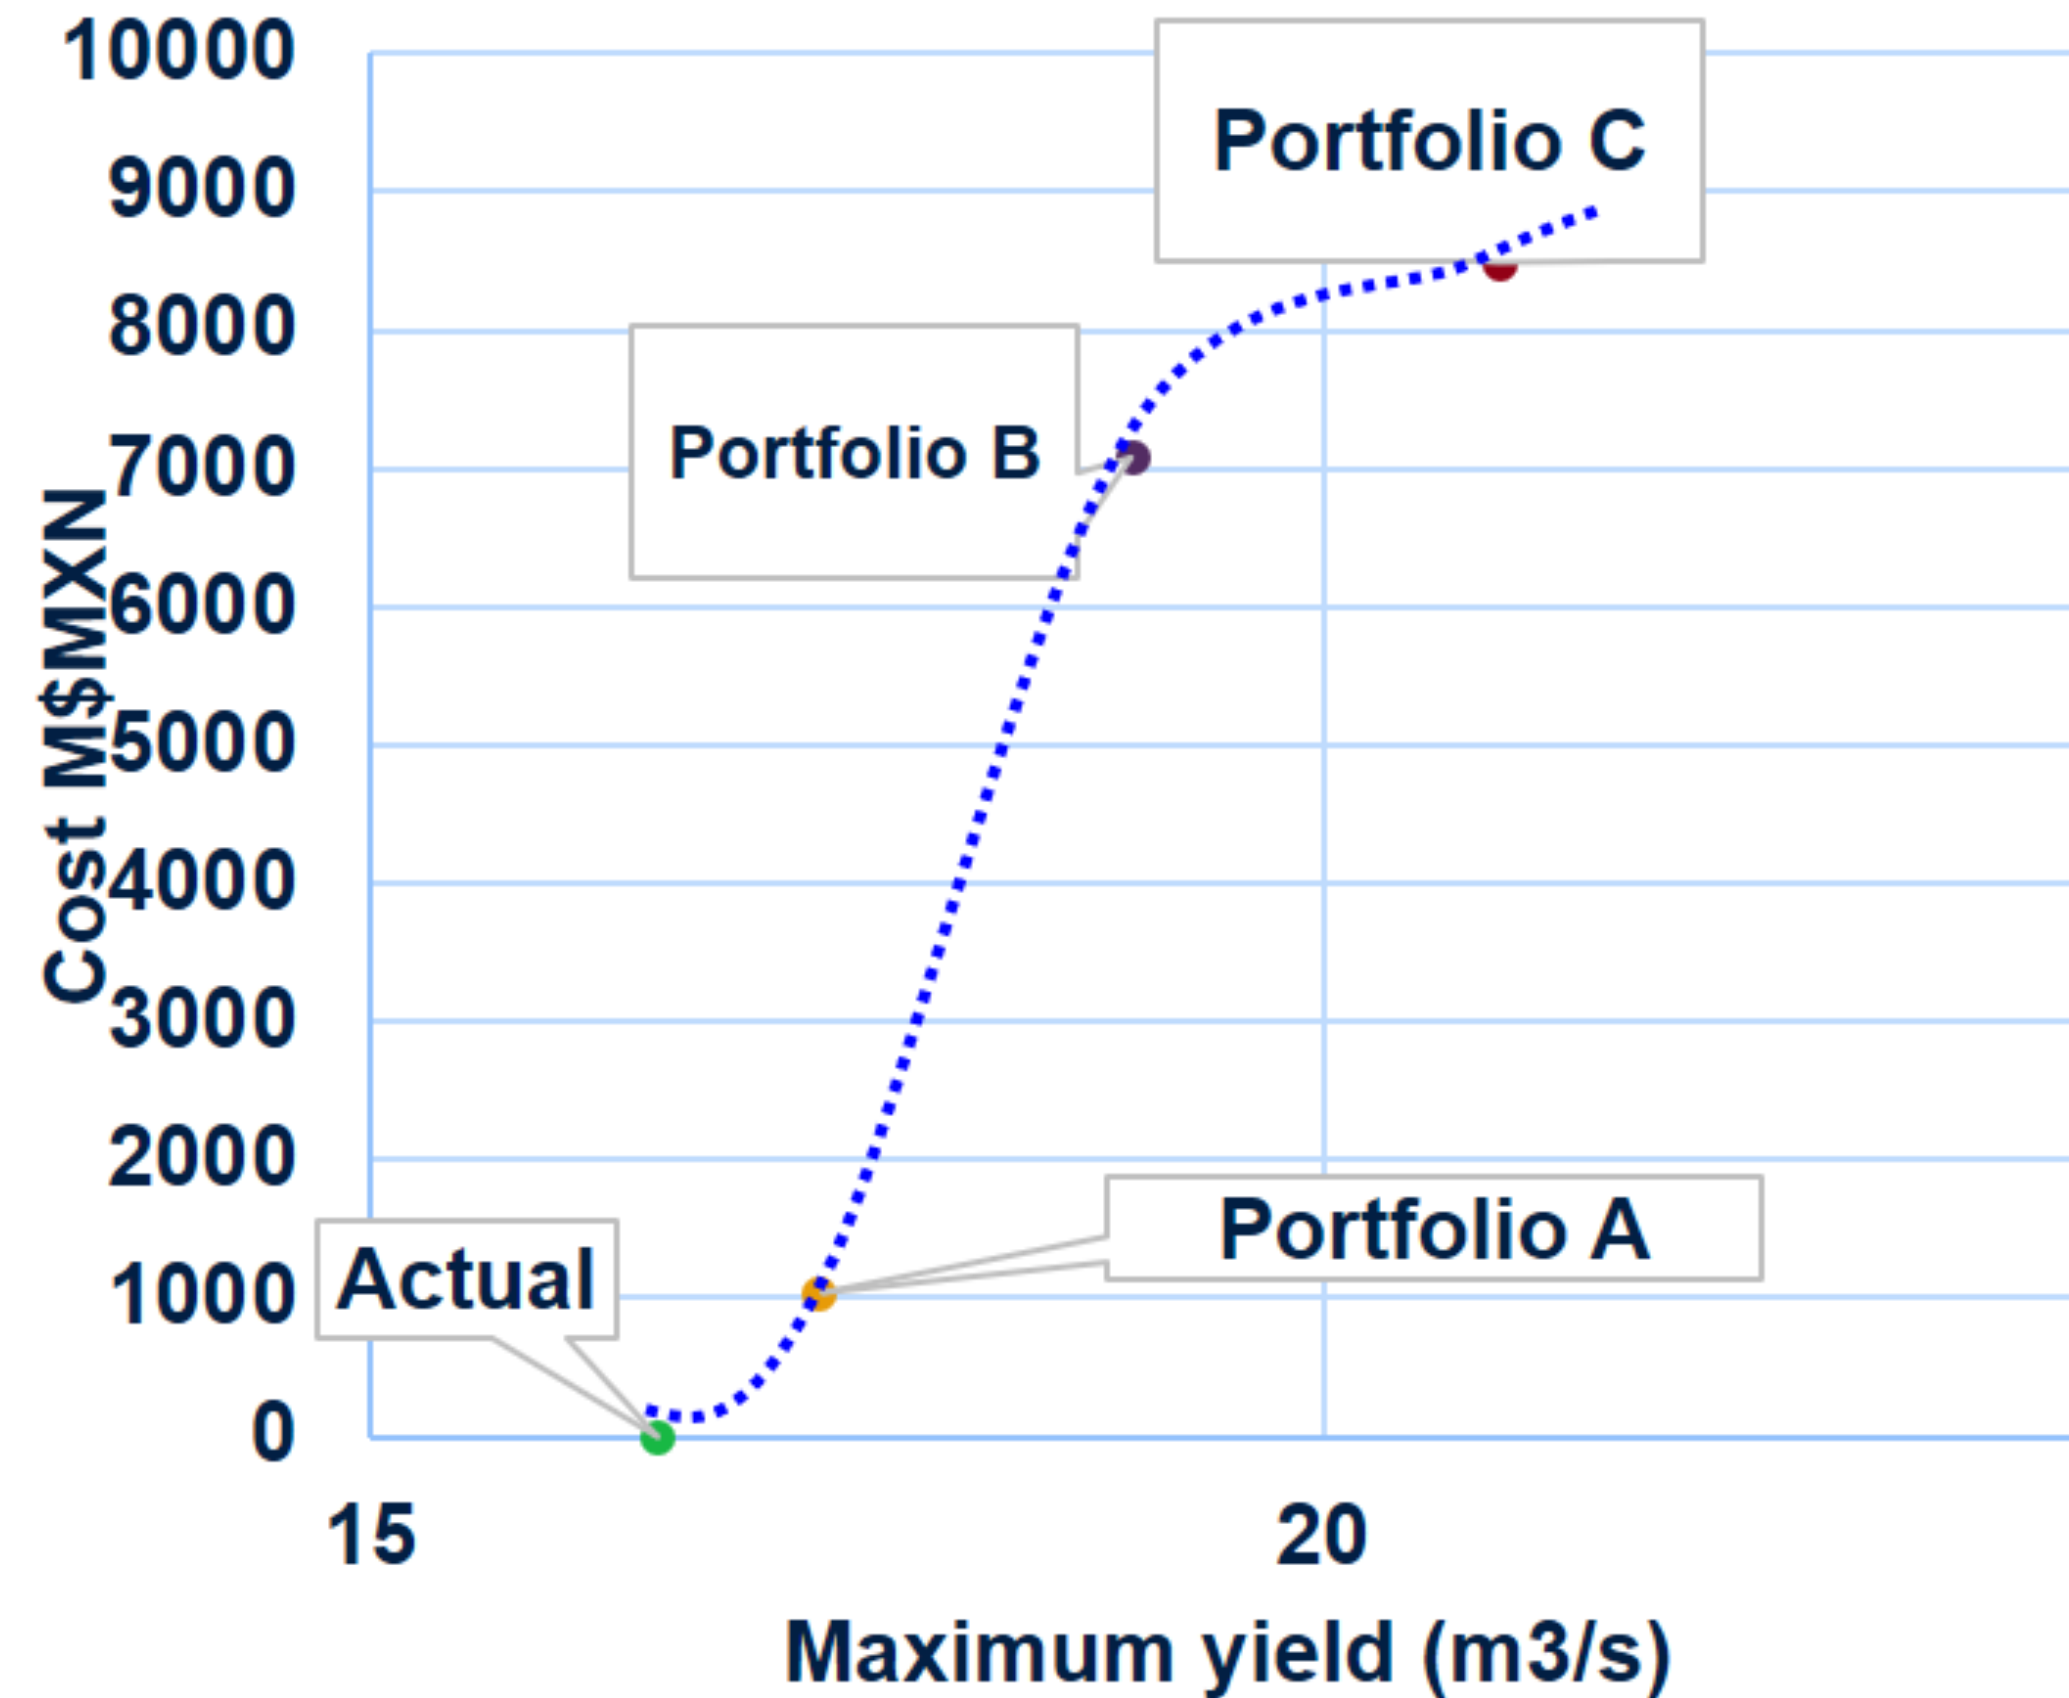

# Traditional planning approach

Engineers determine solutions which minimize costs

What happens when shocks?  
Climate change?  
Social equity?  
The environment?

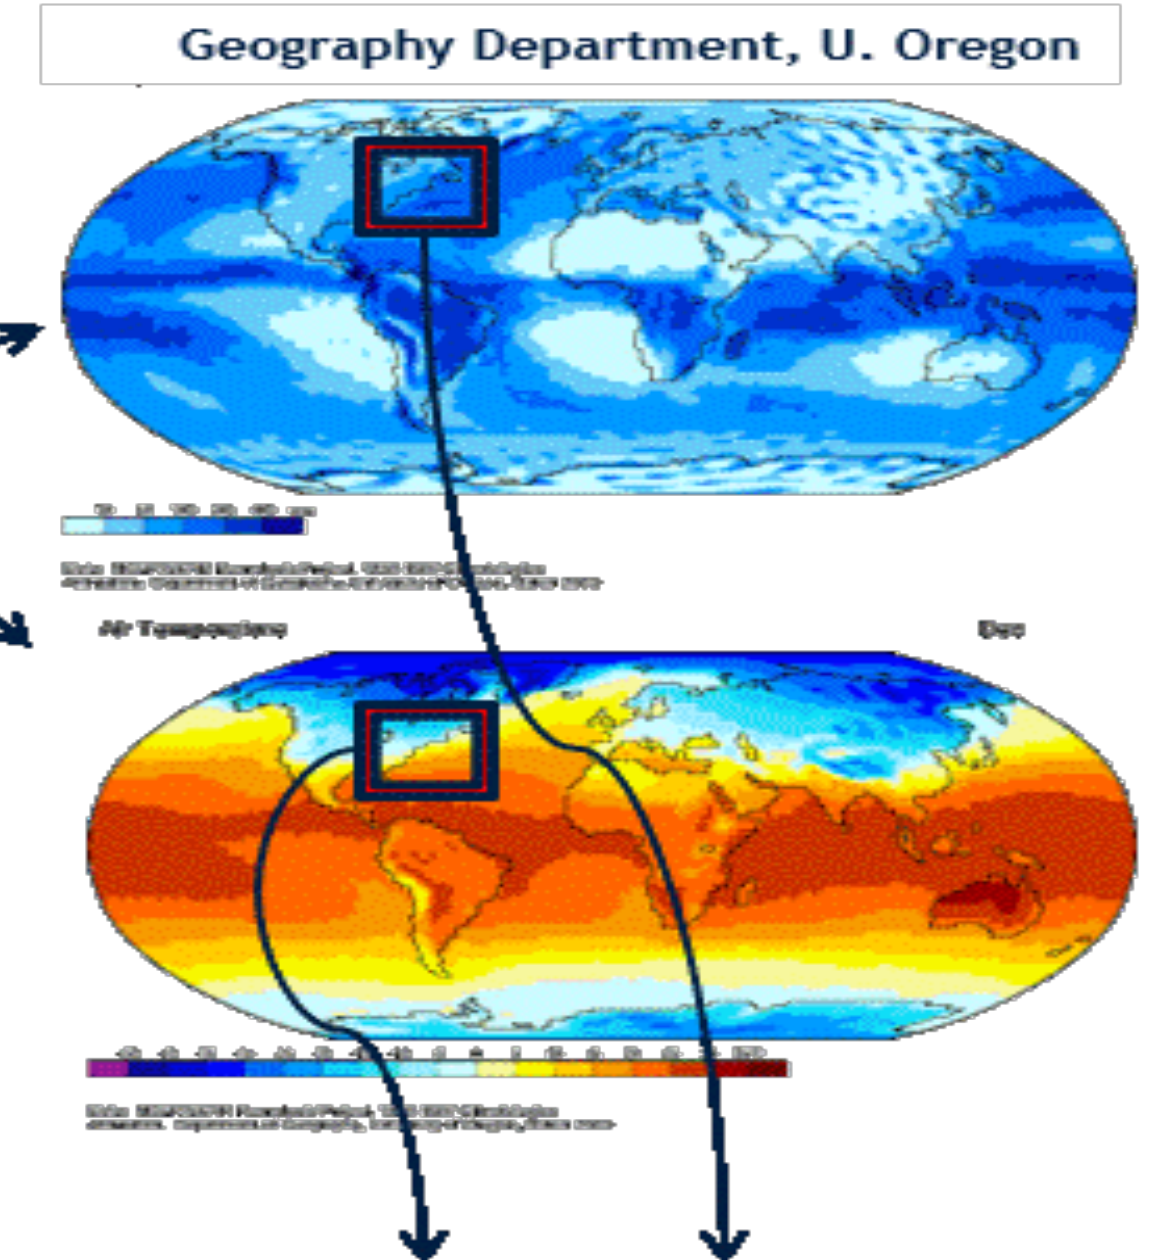

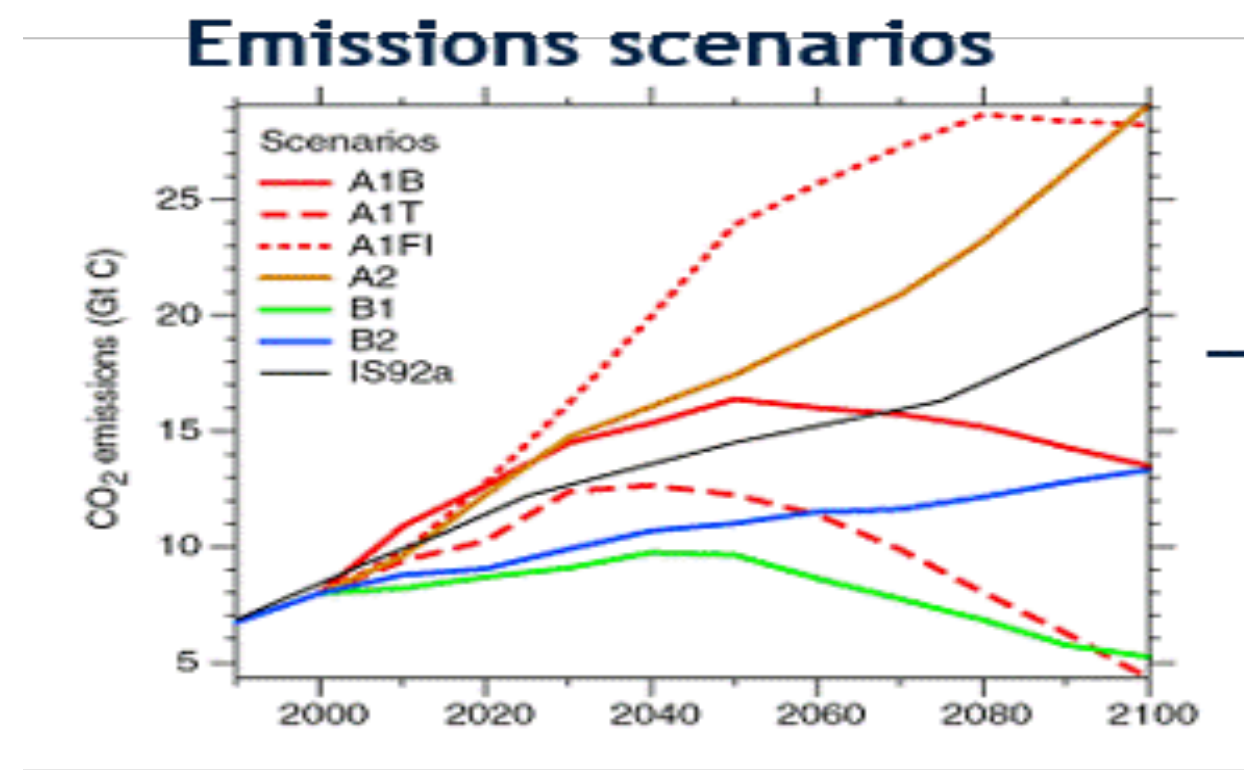

**Traditional planning leads to fragile solutions**

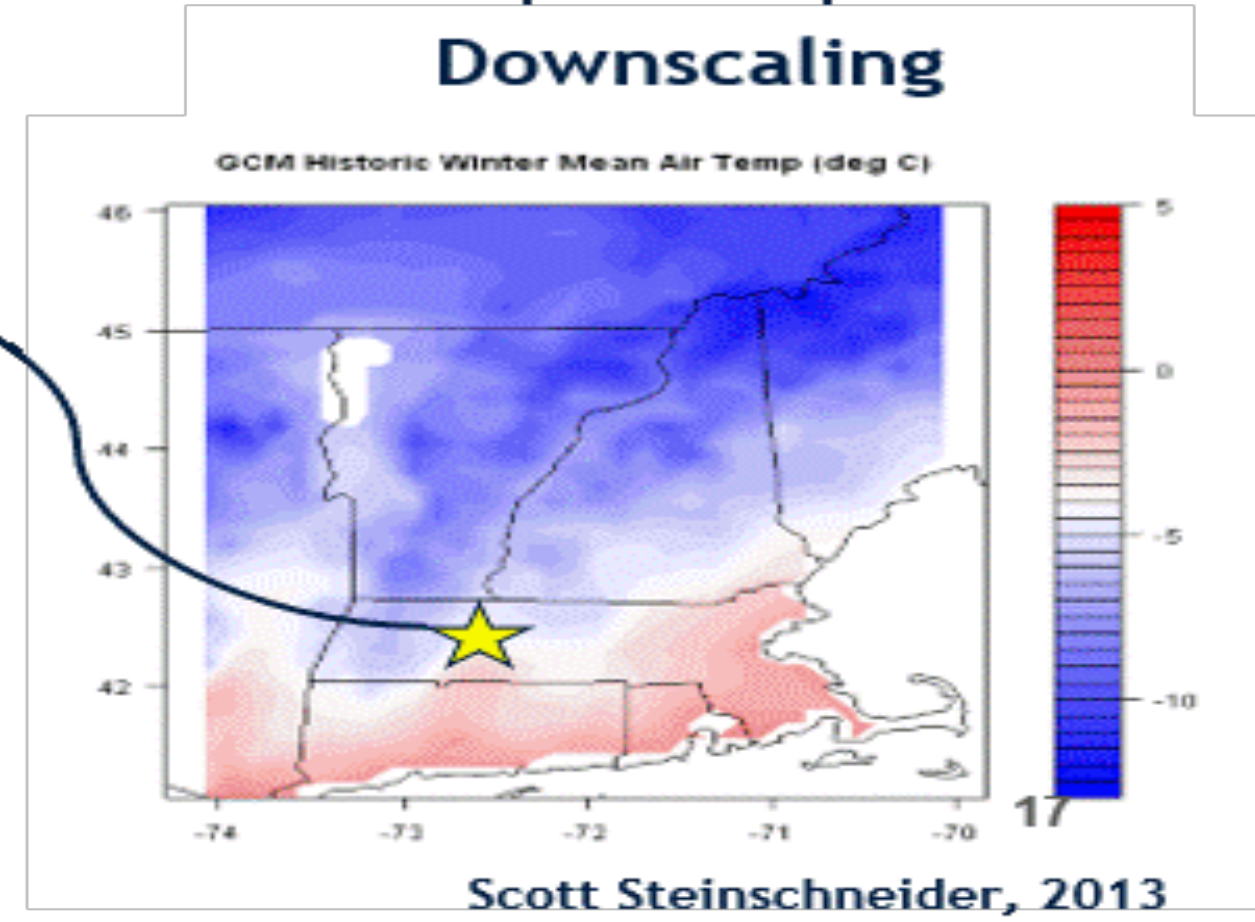

# Uncertainty and climate

**System performance under climate variability**

Greene County, PA Department of Econ. Development

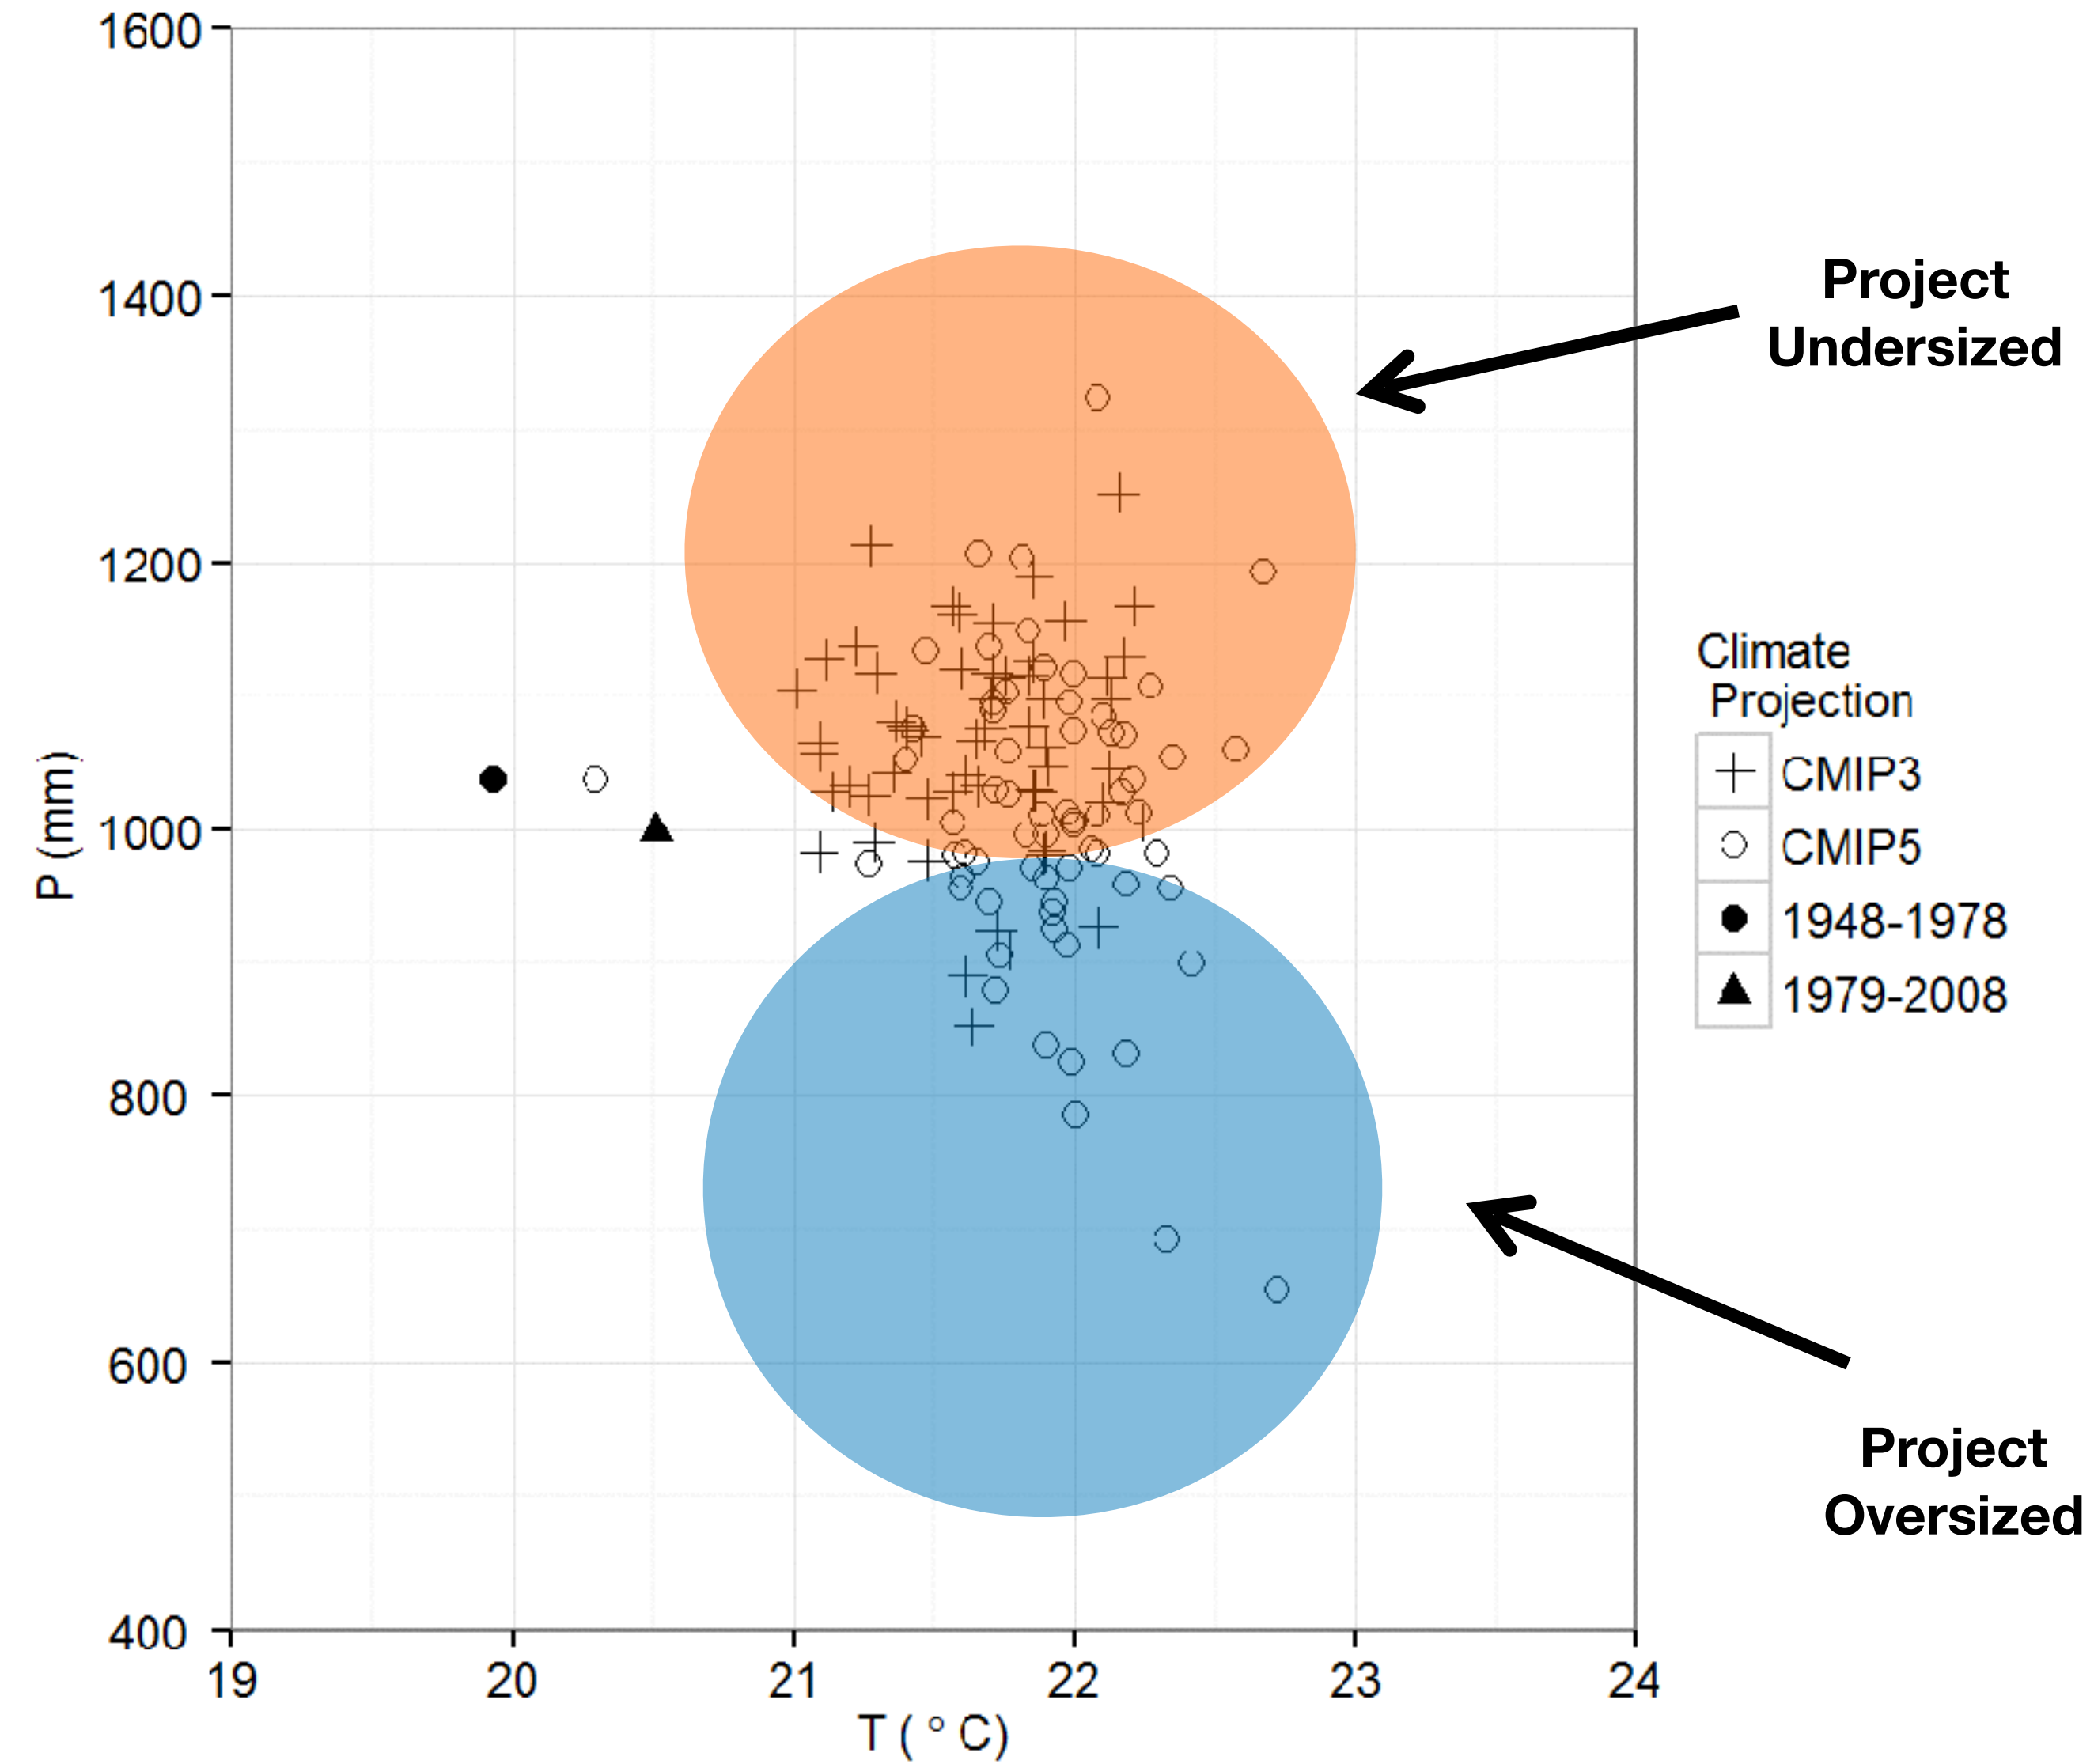

### Hydraulic models

Wisconsin Valley Improvement Company

# The challenge of planning

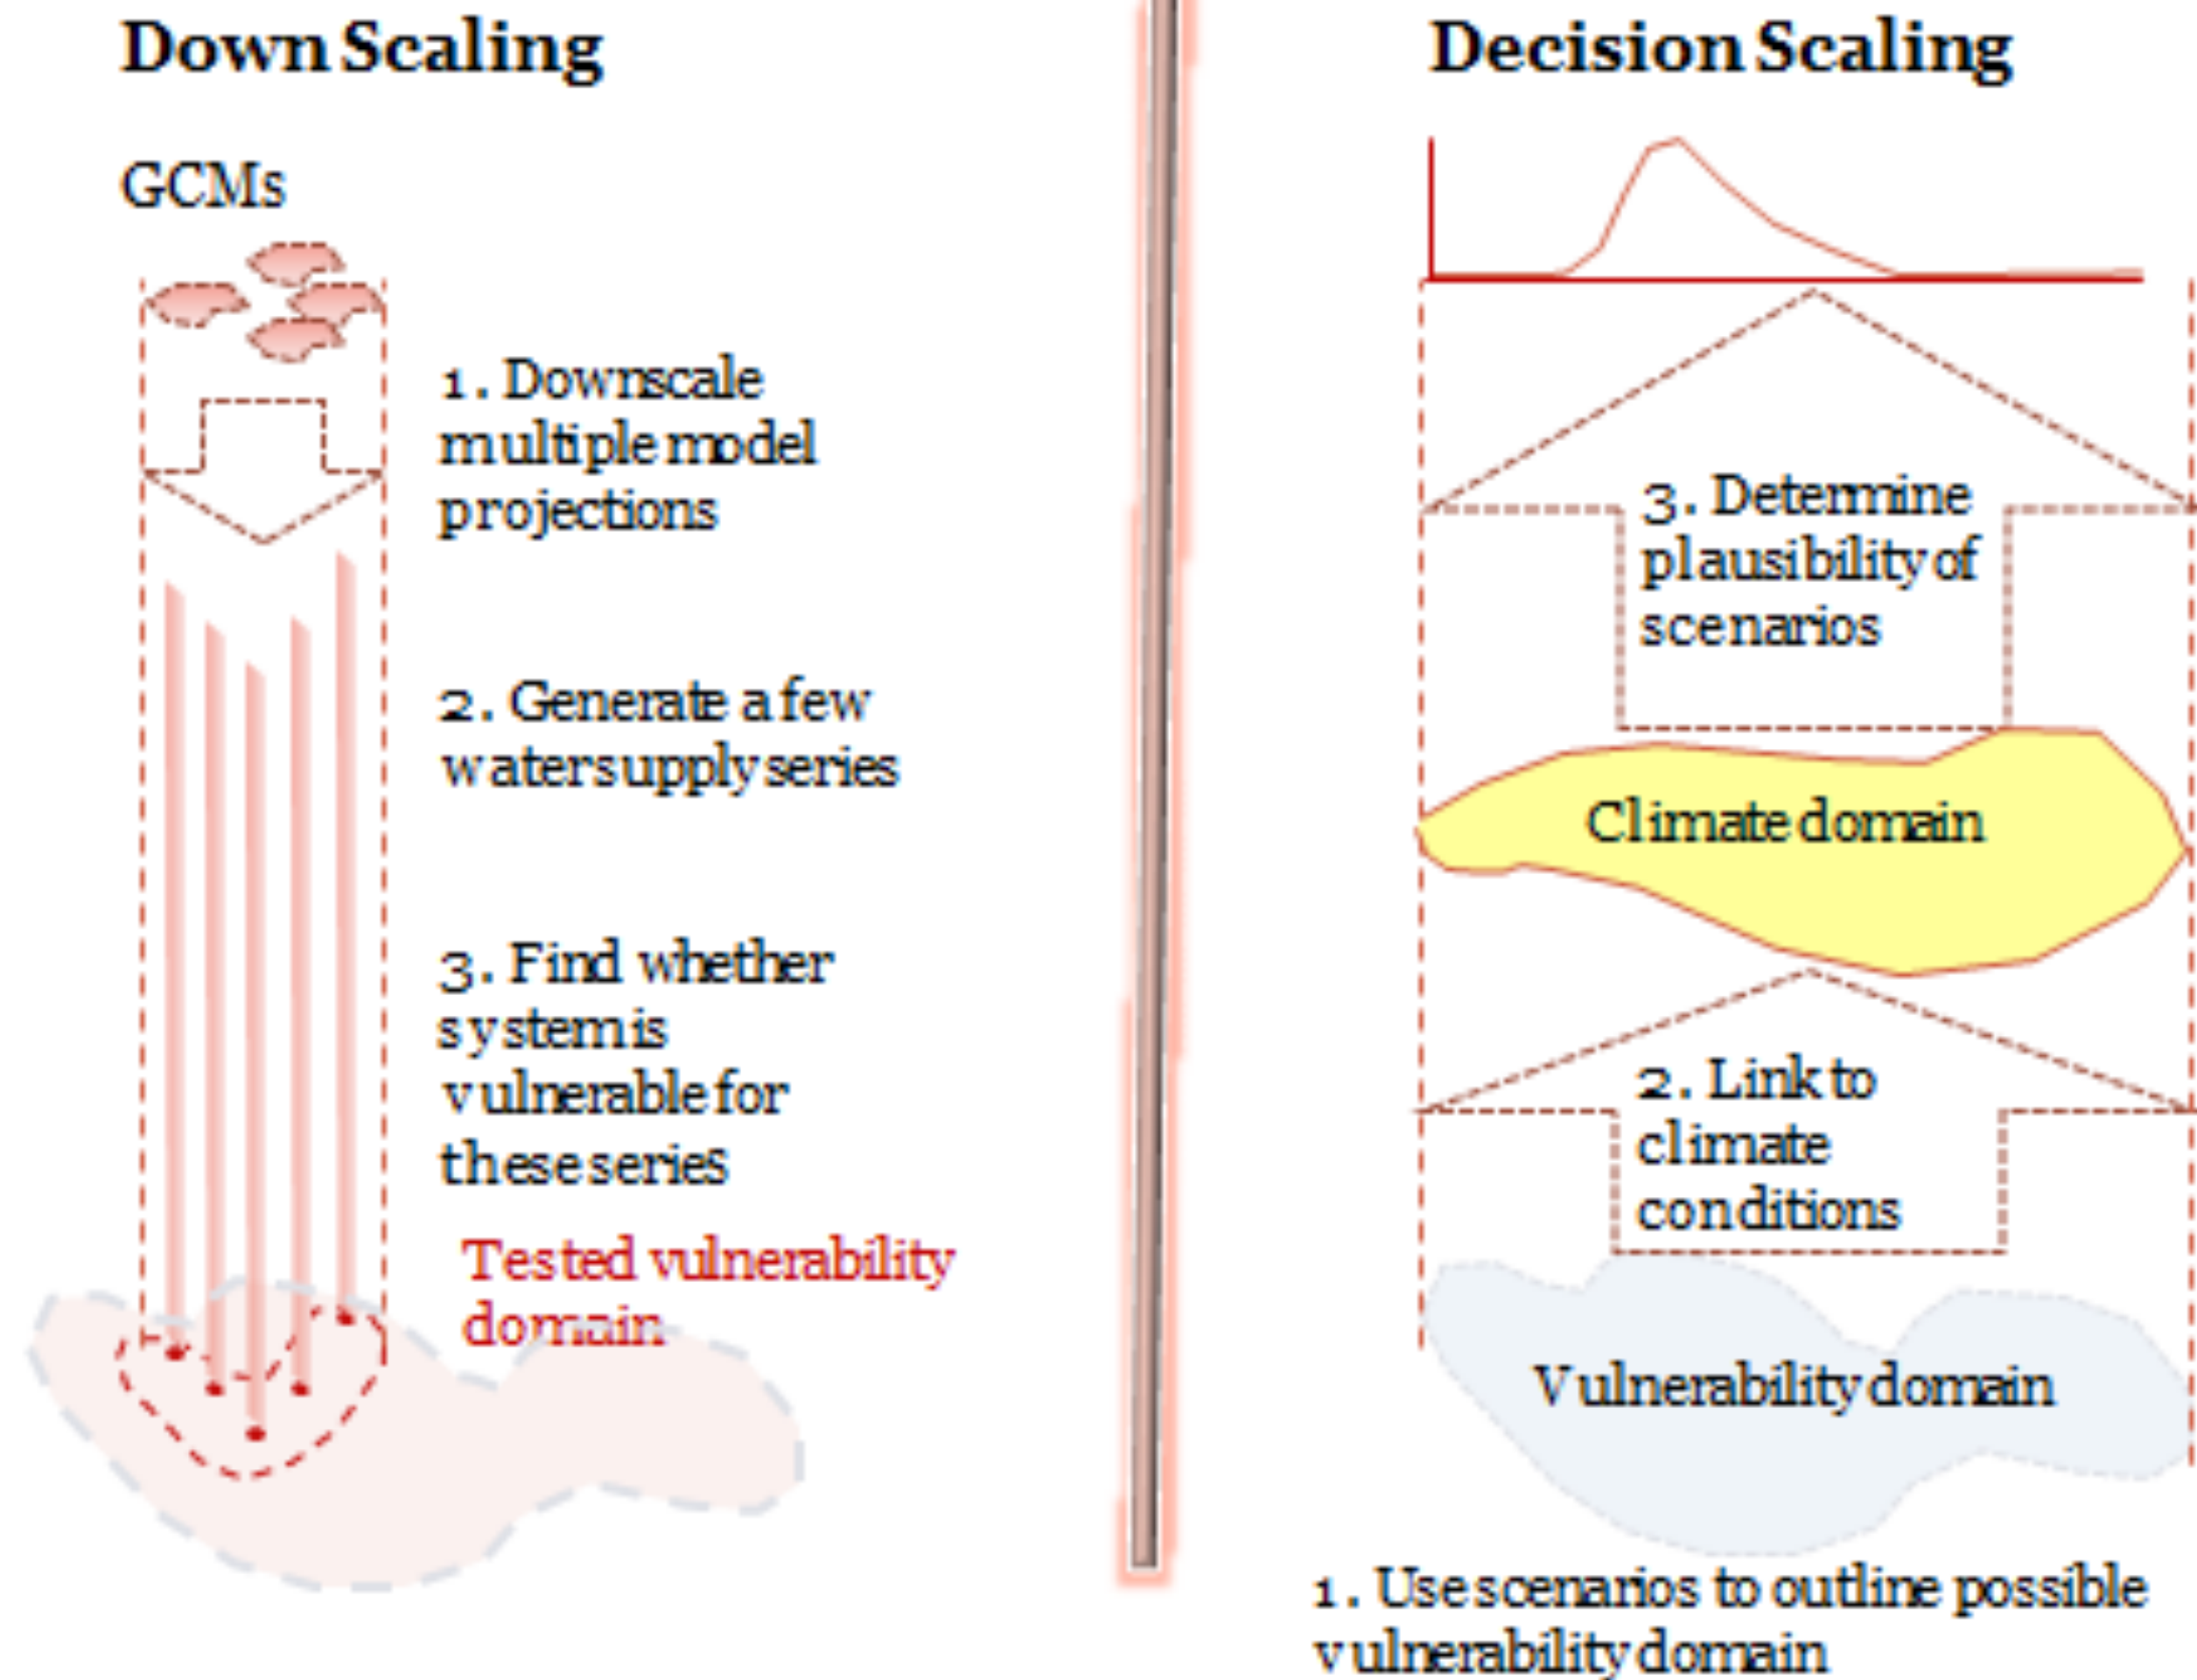

# GCMs: To use or not to use? That is not the question.....

Perhaps they should be used ***differently***. The GCM outputs should ***supplement*** and ***inform*** the predictions from hydrologic models rather than ***drive*** the hydrologic models”

**And climate is only one source of uncertainty. We have many others**

**Systems  
performance**

**Extreme  
events**

**Demand**

**Policy,  
Institutions,  
Regulations**

**Economic and  
population  
growth**

**Social aspects**

**Land use change**

**Tariffs and  
revenues**

**Security,  
cybersecurity,  
terrorism**

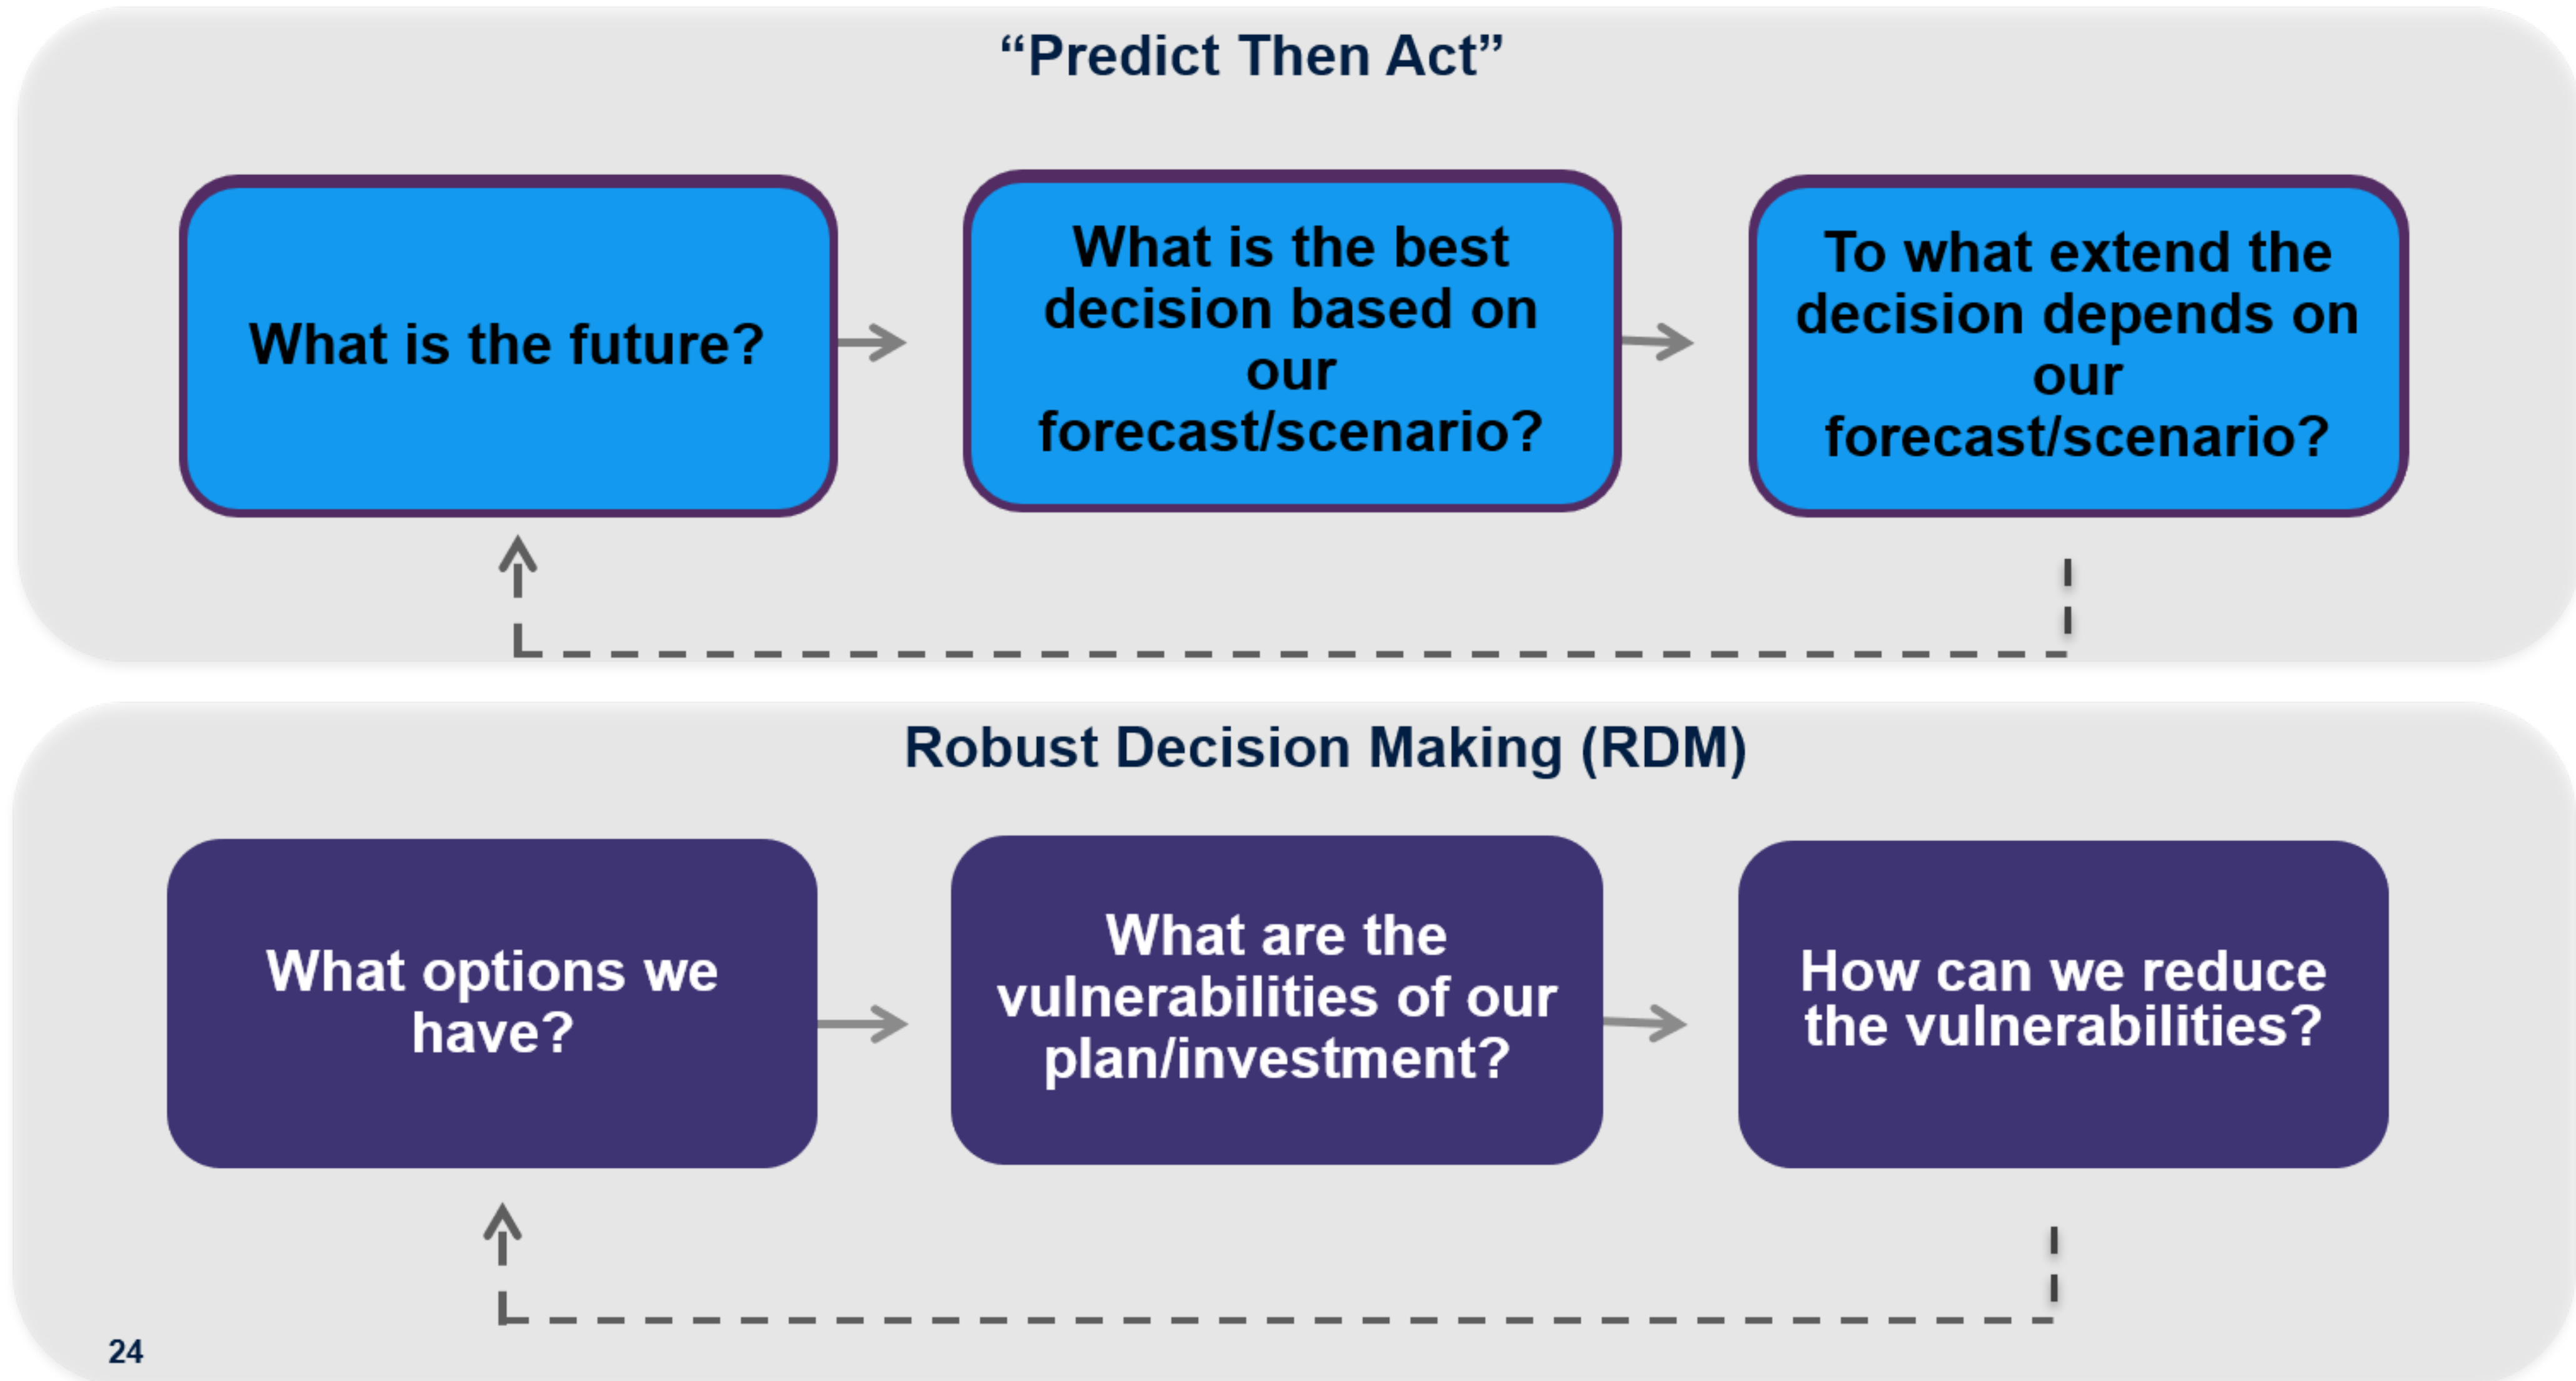

# ROBUST DECISION MAKING UNDER UNCERTAINTY

## Robust Decision Making (RDM) methods ask: What are the limitations of our plans and investments and how can we improve them?

# Motivations for a Robustness-Based Approach

**We don't try to guess what the future conditions will be, we try to be robust and flexible**

# Addressing uncertainties

## IDENTIFYING AND MANAGING CLIMATE RISKS

### THE CLIMATE CHANGE DECISION TREE

- A scientifically defensible, flexible, cost-efficient tool on climate risks
- A bottom-up approach taking into account local realities and climate sensitivity

Exhaustive climate risks analysis: Combining historic data, global climate model projections, a hydrologic-economic water system model, etc.

A rapid project scoping exercise, using a (simplified) water resources system model, compares climate impacts with others such as existing variability, population growth, etc.

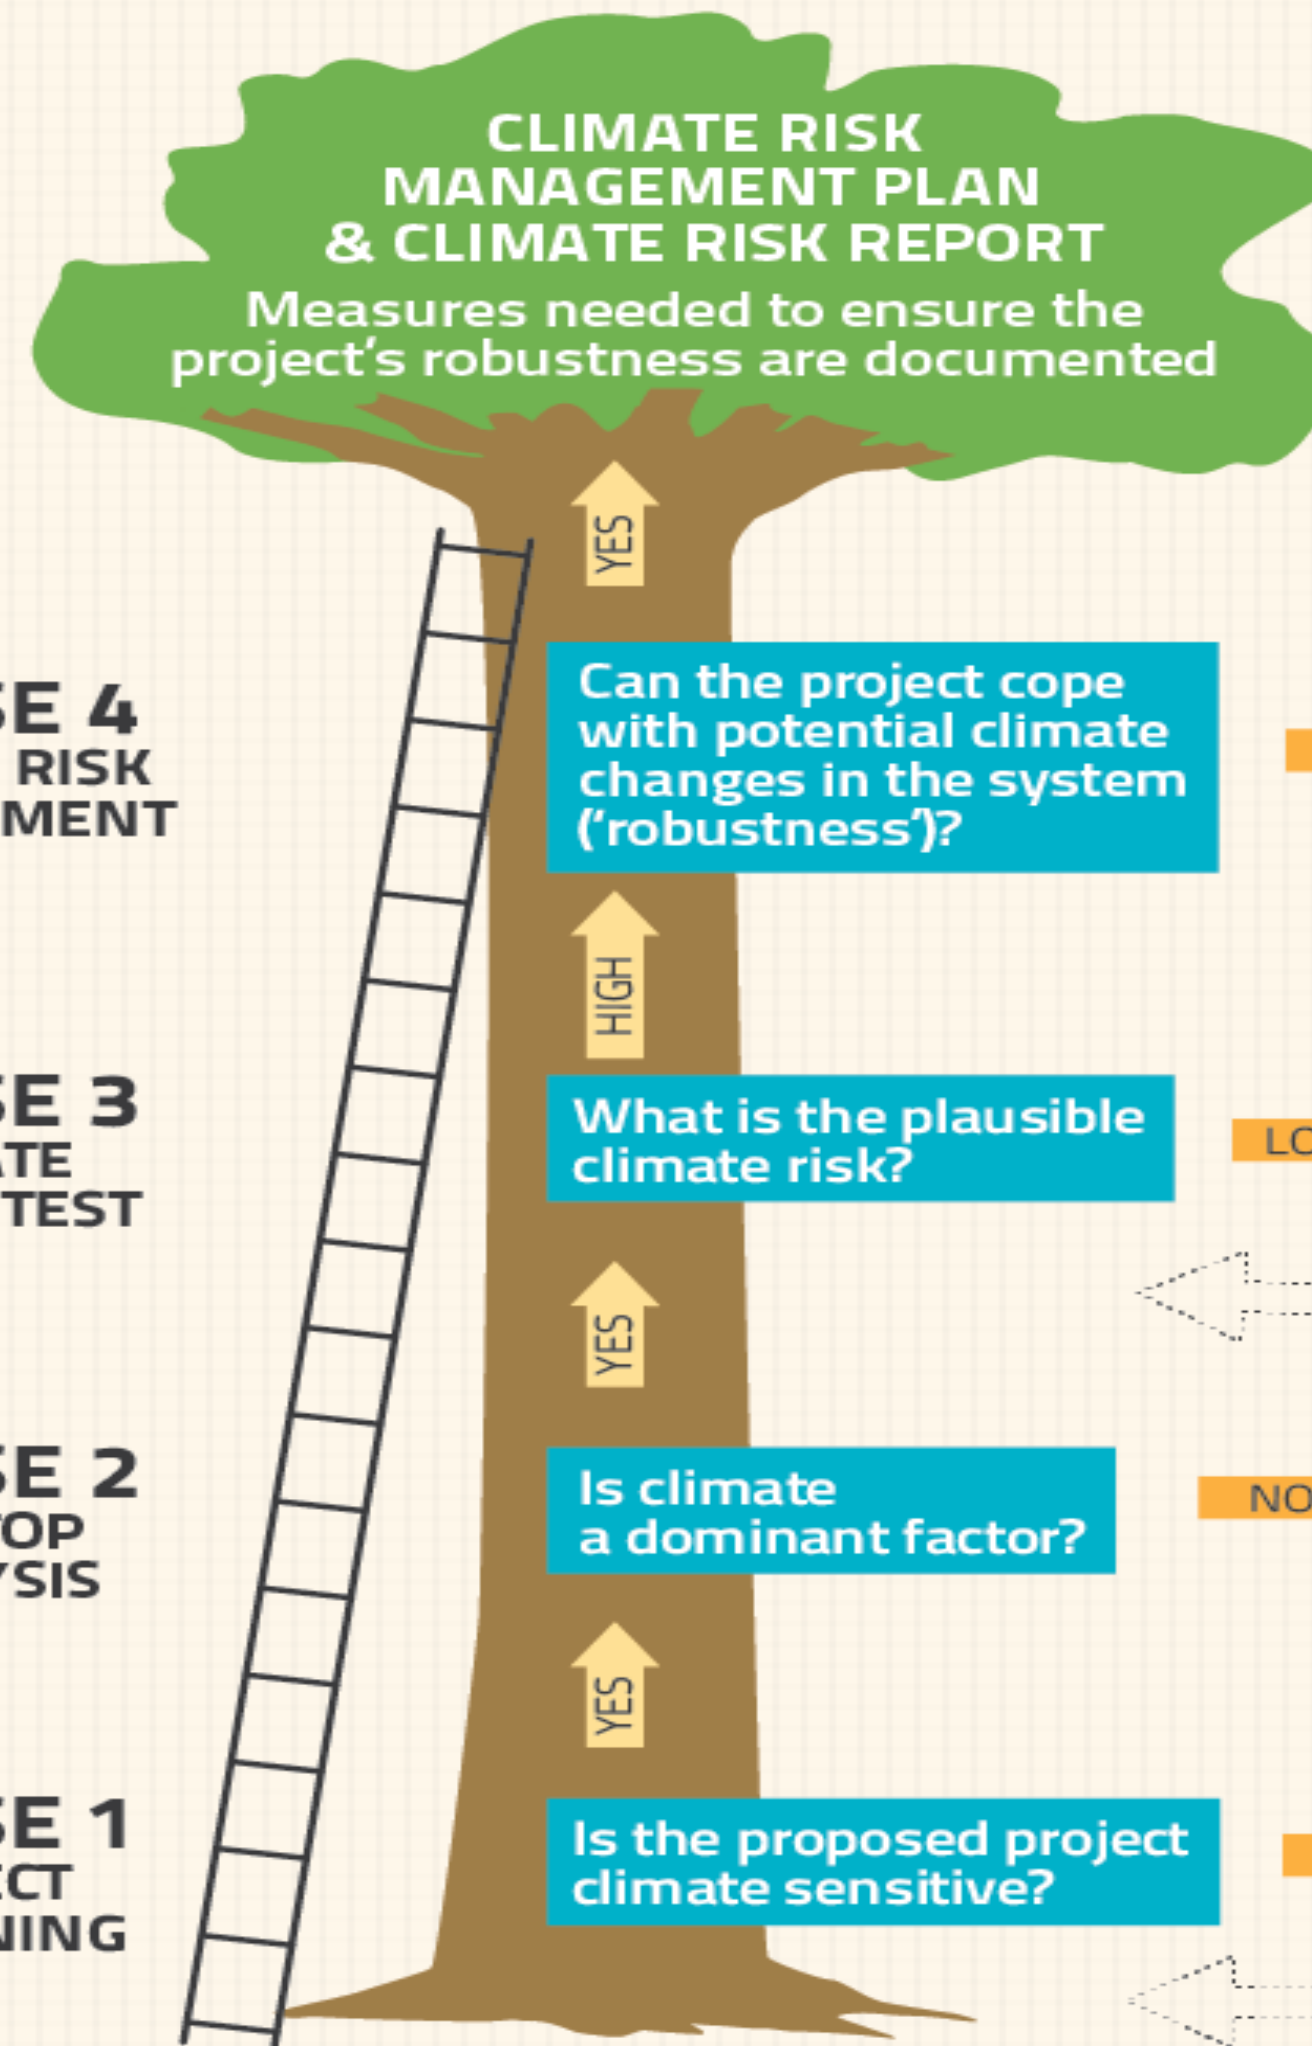

Climate sensitivity screening for all Bank projects: Is climate a factor to take into account?

### PHASE 4 CLIMATE RISK MANAGEMENT

### PHASE 3 CLIMATE STRESS TEST

### PHASE 2 DESKTOP ANALYSIS

### PHASE 1 PROJECT SCREENING

NO

LOW

NO

NO

If project robustness is not achievable, the project is adjusted and put through phase 3 again, or a redesigned project starts at phase 1.

Climate Risk Report

Climate Risk Statement

Climate Screening Worksheet

# Addressing uncertainties

Scenario Discovery of the 335 MW design

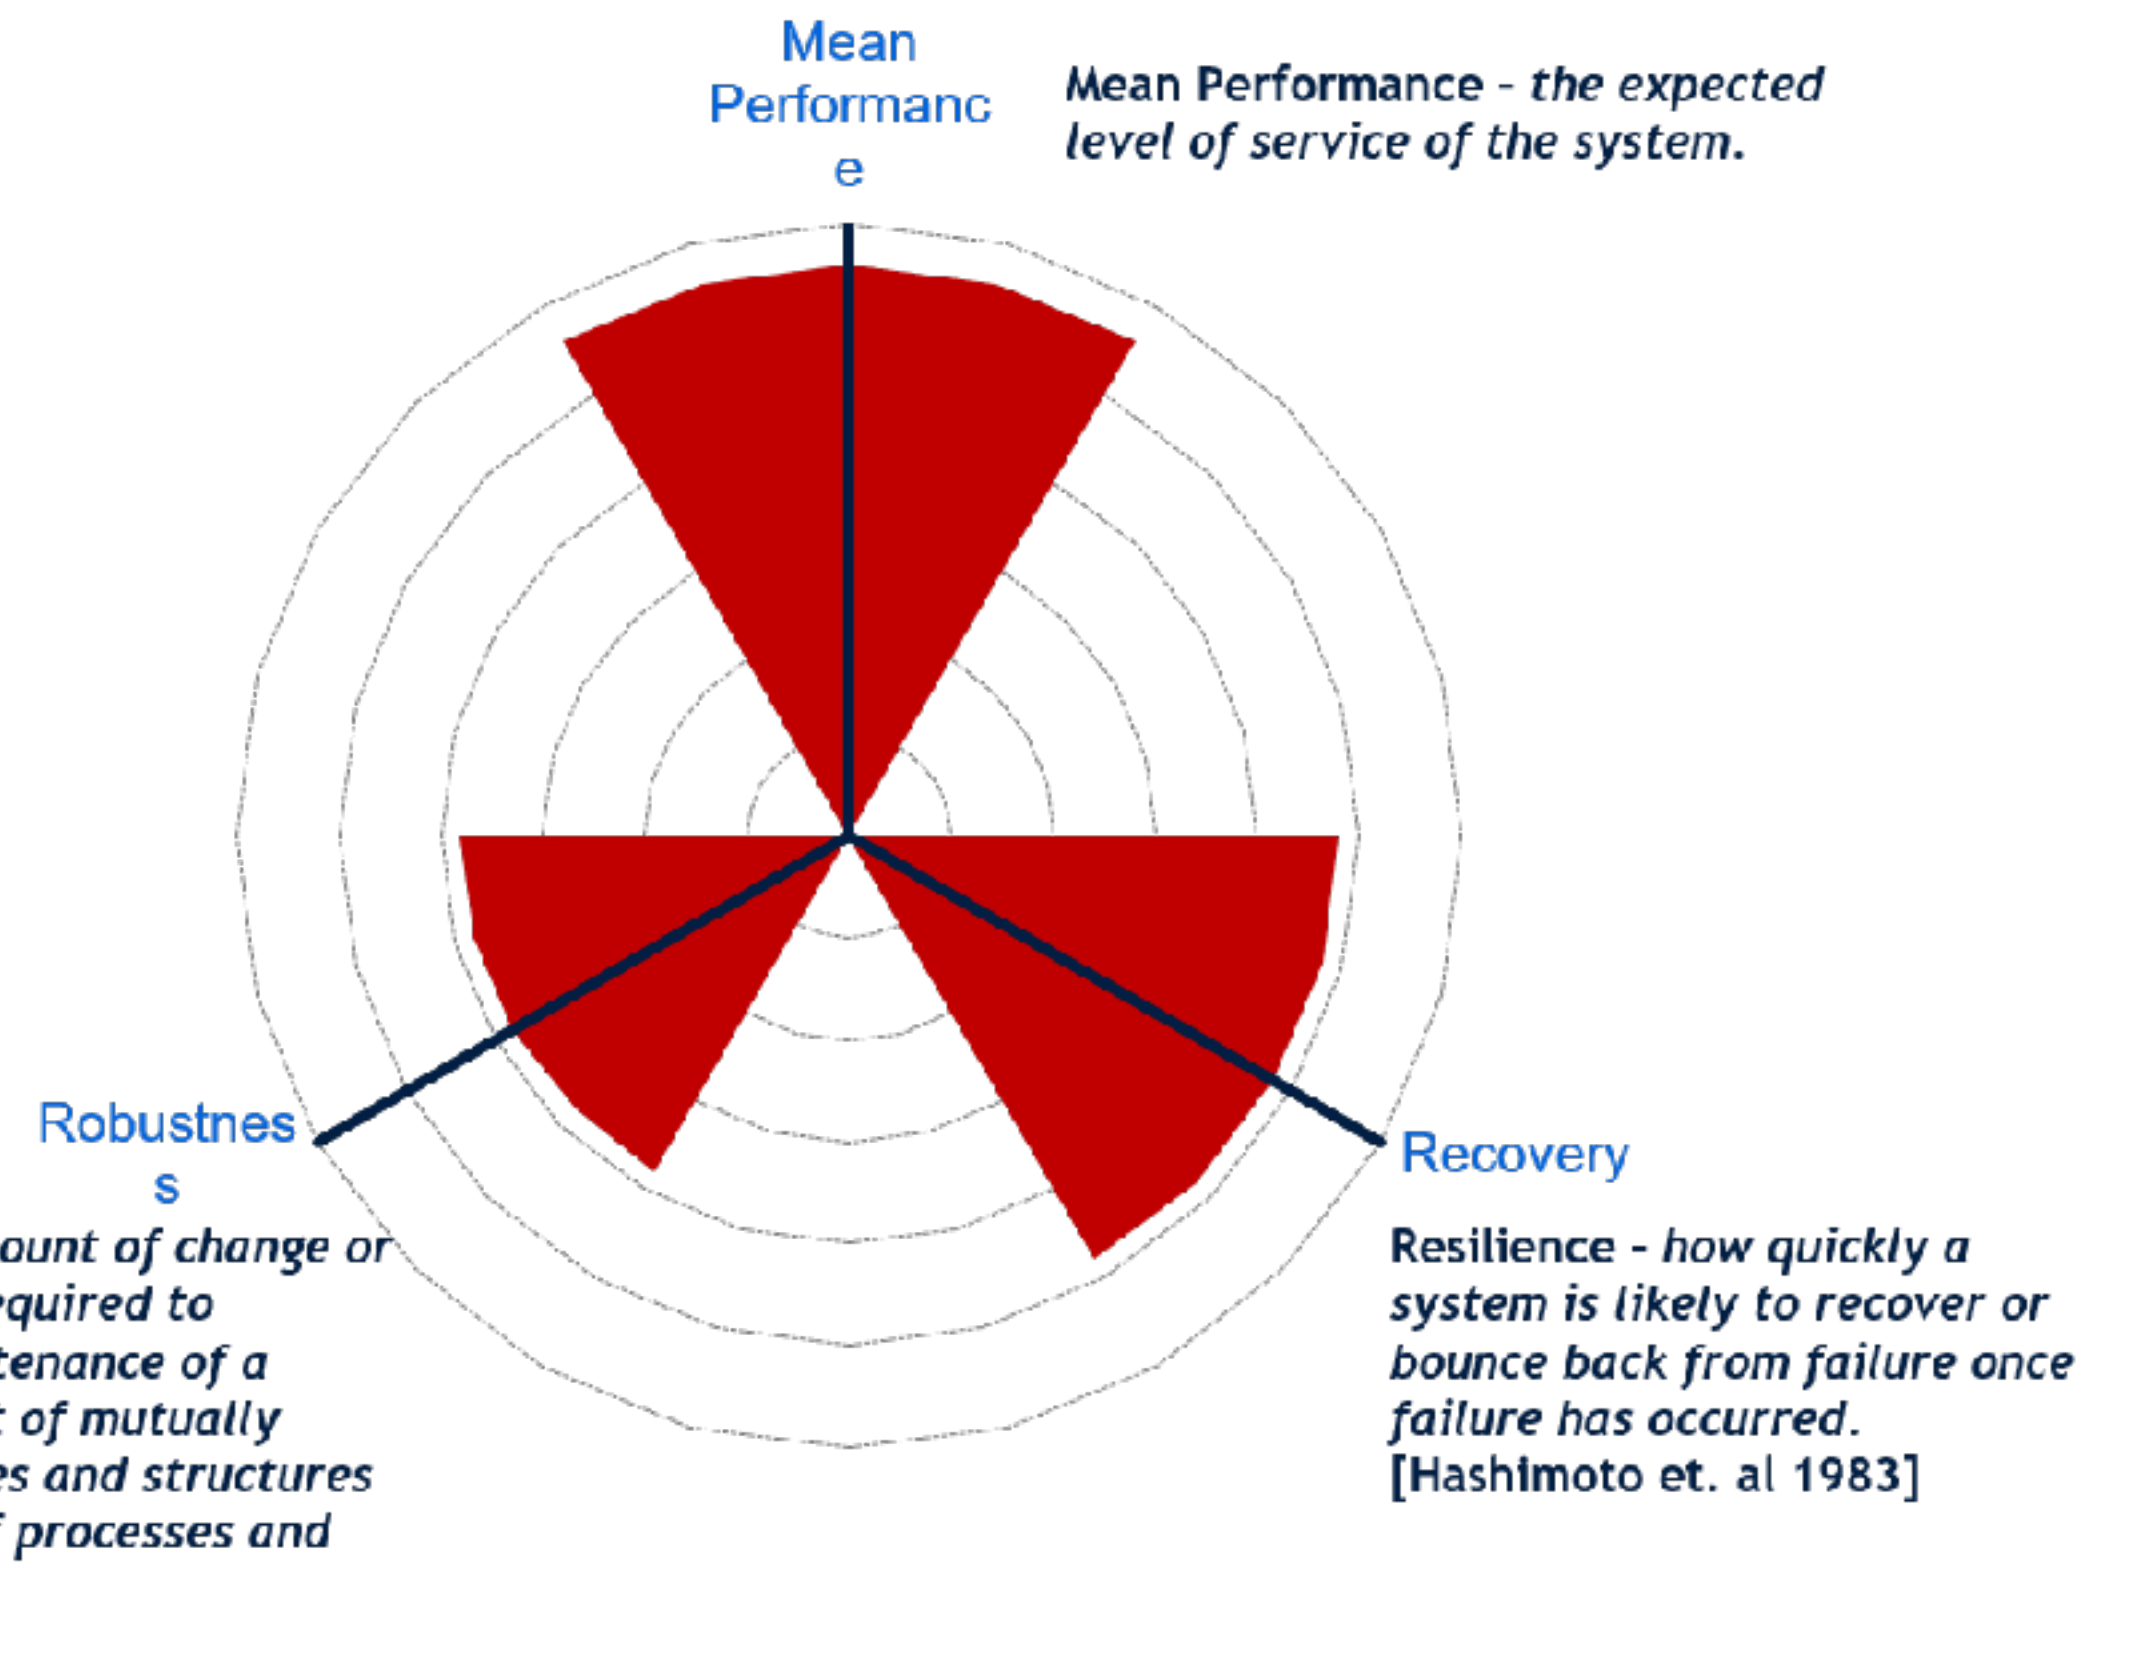

# The need to incorporate other metrics

What would we like to know:

- how often and
- how bad the system fails,
- and if it fails how can it recover?
- How is the performance under multiple plausible future climate states?

- Reliability = number of failures
- Vulnerability ~ maximum damage
- Resilience ~ recovery
- Sustainability ~ trend in performance
- Robustness = project performance over plausible climate range

**An example: Cutzamala System**

## Significant challenges in the Valley of Mexico

*By 2025, the percent of Mexico City's population with access to acceptable quality of water service is projected to decrease from 82% to 28%.*

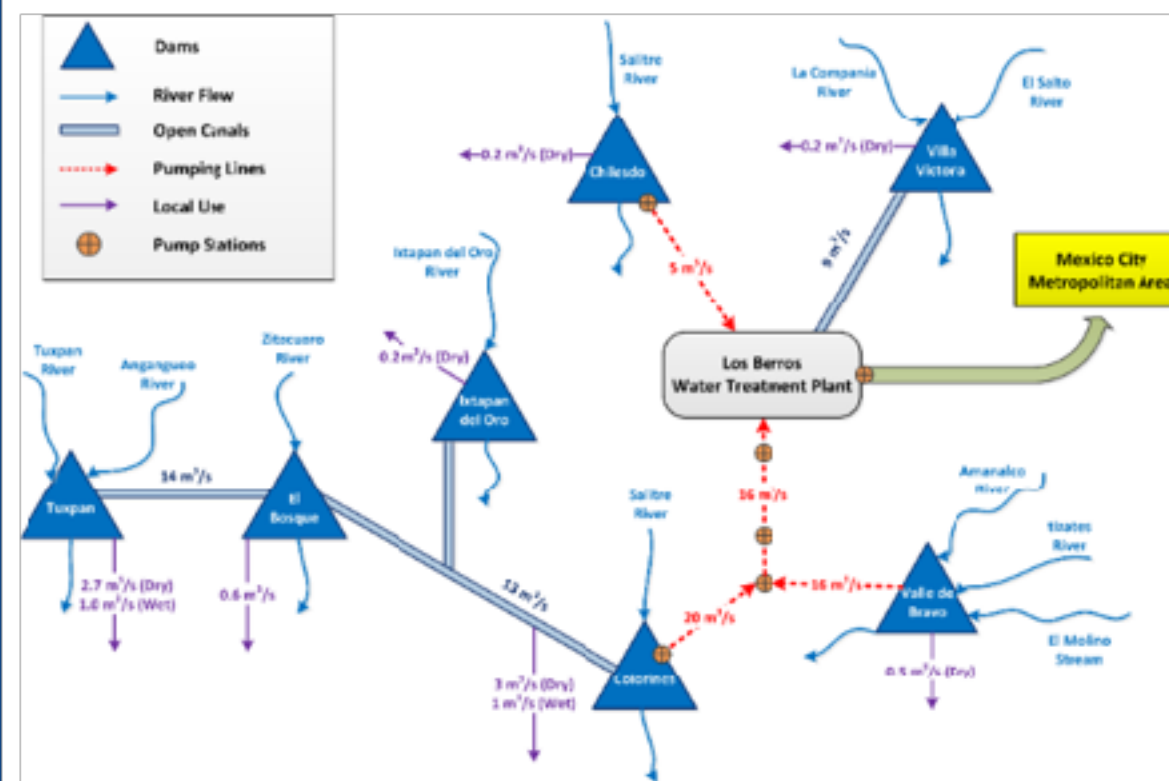

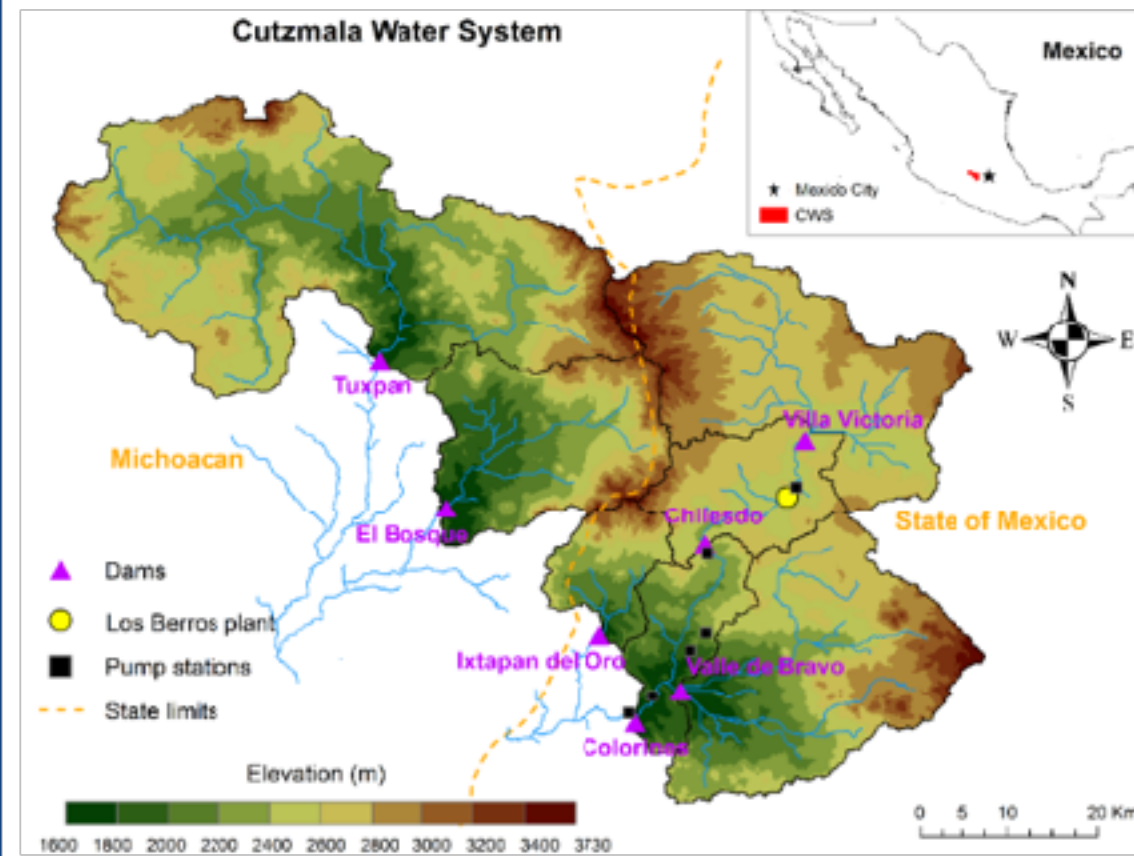

- Overexploitation of the aquifer is currently estimated at double the recharge rate,
- Subsidence in the city ranges from 4 to 26 cm per year, depending on part of city
- Losses in the distribution system are estimated to be 42% of the total water supplied to the city (this includes water not accounted for, illegal capture and leakages.
- Equity and inclusivity are major issues; water scarcity and shortages are borne disproportionately by the poor.
- Urban flooding and storm water management are a chronic problem.
- The system is highly vulnerable to earthquakes and slow to recover

# Collaborative modeling framework

## Cutzamala

## Inputs

Temperature\*

Precipitation\*

(HYMOD)

## Objectives

(metrics based on performance targets)

Max MCMA

Target Deliveries\*

Max Agricultural  
Target Delivery \*

Max equity of allocation

\* Indicates variable treated as uncertain in the analysis

## Internal Variables

### Systems Model

- Network (Pipes & Canals)
- Pipe and Canal Capacity
- Reservoir capacities \*
- Reservoir and pumping station operations
- Agricultural withdrawals\*

### Decision Variables

- Investment options
- Reservoir operations

## Outputs

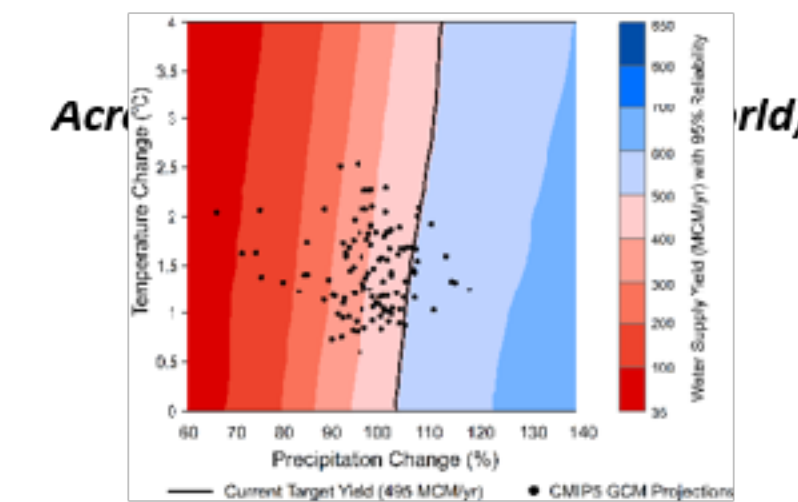

Simulated vs Target Deliveries

Performance Metrics

Investment Portfolios

## Some results: comparing investments

- Current system is very vulnerable to climate change.
- The system can be substantially improved through reoperation of current infrastructure as well investment in connectivity within the systems.
- Evaluation of options in relation to resilience metrics helps to produce solutions that will be robust to multiple futures.

## Some results: comparing investments

- Current system is very vulnerable to climate change.
- The system can be substantially improved through reoperation of current infrastructure as well investment in connectivity within the systems.
- Evaluation of options in relation to resilience metrics helps to produce solutions that will be robust to multiple futures.

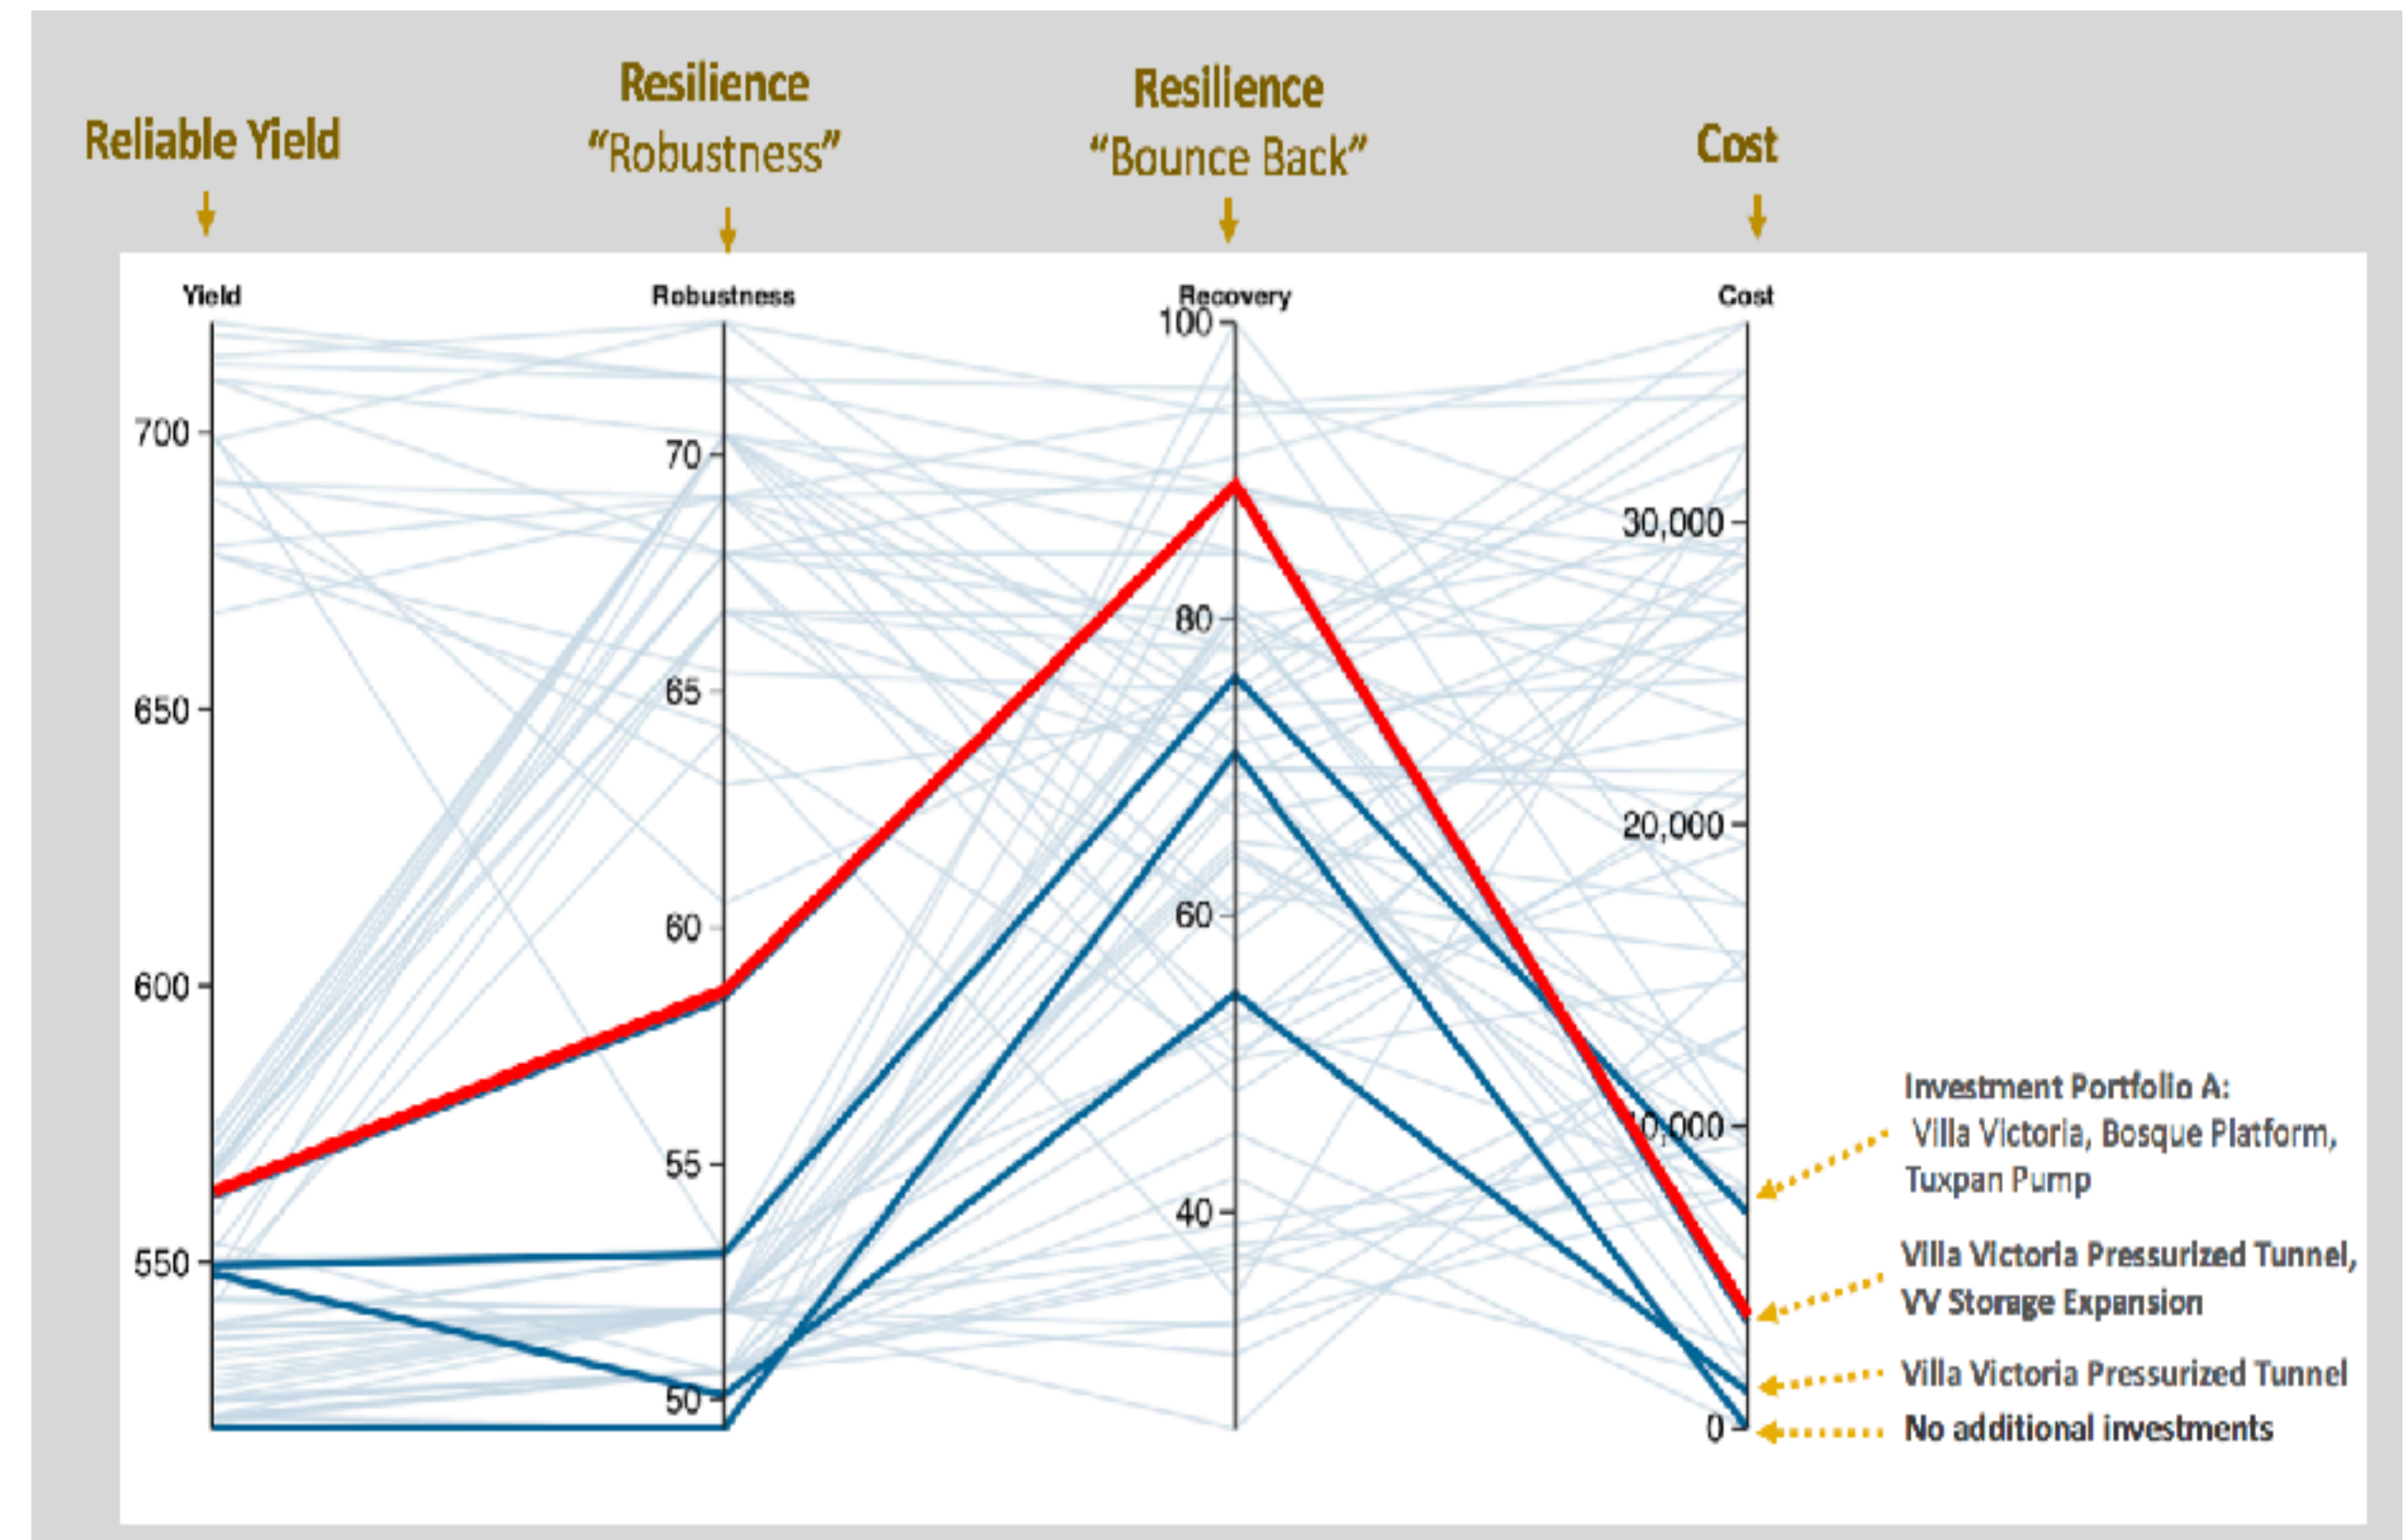

## Some results: comparing investments

- Current system is very vulnerable to climate change.
- The system can be substantially improved through reoperation of current infrastructure as well investment in connectivity within the systems.
- Evaluation of options in relation to resilience metrics helps to produce solutions that will be robust to multiple futures.

## Tradeoff comparison of investments across multiple objectives

| Inversión                | Rendimiento<br>Máximo<br>(m3/s)                                                             | Confiabilidad<br>(%)                                                                       | Recuperación<br>(dias)                                                                   | Desempeño<br>durante sequia<br>(%)                                                          | Costo<br>(MM\$MXN) |
|--------------------------|---------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------|--------------------|
| Sistema Actual           |  14.87   |  94.6   |  >6   |  87.0%   | -                  |
| Bosque Plataforma        |  15.09  |  97.2  |  3   |  98.0%  | \$ 25.21           |
| Tuxpan -Bomba            |  14.87 |  94.6 |  >6 |  87.0% | \$ 1,639.63        |

| Villa Victoria & Canal   |  14.84 |  94.1 |  3  |  92.4% | \$ 5,538.20        |
| Bosque – Colorines Canal |  14.97 |  96.0 |  >6 |  90.4% | \$ 7,782.53        |
| Temascaltepec            |  17.69 |  98.5 |  3  |  99.3% | \$ 19,675.53       |

## 5 KEY TAKEAWAYS

## 5 Key Takeaways

- Facing a new reality with multiple challenges. Need to move from risk and probabilities to embracing uncertainty
- Climate change is an aggravating factor that cannot be analyzed in isolation from other factors
- Traditional planning and investment design processes and methods are not sufficient
- Different approaches exist and have been applied for over a decade and help to mitigate the perfect storm
- Approaches need to be bottom up and with the participation of key stakeholders
